SFNX

ARTIFICIAL INTELLIGENCE

INTRODUCTION

It's the age-old question: what do I want? By extension, what do *you* want? What do we, as members of the global human family, want?

Psychology and psychiatry - and religion and philosophy before them — have been striving to provide the answers for millennia, based on the essential assumption that human beings equate the meaning of life with maximum possible contentment in every conceivable sphere of human emotion and endeavor.

Today, in an age of breakneck speed, when the constant deluge of technological innovation is expected to make our lives easier than ever before, we are, ironically, in many ways lonelier, more scared, and more lost than we've ever been. It's not surprising, therefore, that most people seem to be in therapy — or in serious need of it.

Yet given the enormous weight accorded to and placed on psychiatry as a portal of solutions and resolutions, the question pertaining to its own function remains: just how reliable, and ultimately effective, are the proceedings that take place on the psychiatrist's couch?

There is, indeed, a host of fundamental issues to consider before taking the rather risky step of beginning to see a therapist: how much of a role do his/her own ego and judgment play in the provided therapy? Which specific school of psychiatry does he/she adhere to, and how does one determine its effectiveness? If, for instance, you happen to be your psychiatrist's last patient for the day, can you be certain that he/she is actually giving you his/her undivided attention? Or are you just another face, just another account number, supporting your therapist's lifestyle?

People — even many of those who regularly receive therapy — are understandably skeptical, while countless millions more simply cannot afford the extensive, often decades-long, therapy they need, or think they need. For all intents and purposes, and in most cases, psychiatry has become a prohibitively expensive luxury, and one which might well lead to an ongoing flurry of questions than answers.

MEET SFNX

A singular AI (Artificial Intelligence) invention, SFNX is poised to take psychology as we know it to the next level.

Consisting of an elegantly simple consumer device, SFNX responds to your psychological queries — whether about you or others. Therefore it functions as an always-available, thoroughly informed personal psychologist. It also learns from your input and that of others, constantly evolving and expanding its knowledge of the human condition, and humanity as a whole, with the overarching goal of improving human life.

HOW SFNX WORKS

SFNX is a user-friendly Wi-Fi device. It is touch-sensitive, and comprises voice-recognition and face-recognition functionality.

As you begin to use the device, it asks you a series of basic questions regarding your psychological history, current psychological state, and any known conditions you might have. Your responses help SFNX form your unique personal database, which is stored on cloud connected to a proprietary, dedicated AI server. The information you provide, as well as that provided by others, remains forever confidential, never to be shared with the public or marketing agencies.

The AI server already contains a massive trove of psychological and psychiatric information, culled from hundreds of years' worth of research and published literature in these fields. Once you provide SFNX with your psychological-background information, it integrates it into the existing meta database, thus effectively refreshing it. Now the device is ready to respond to your specific queries regarding the current psychological issues you might be experiencing.

SFNX does not diagnose psychiatric conditions. Rather, it sheds light on and accurately articulates the particular psychological state you're in, based on the information you have provided it. Accordingly, it goes on to make eminently learned suggestions as to how you might proceed to overcome or resolve the issue(s) you are experiencing.

Beyond the personal sphere, SFNX also helps you form a highly informed impression and assessment of others. Whether you're interested in a personal relationship, a business collaboration or partnership, or an intergovernmental initiative that involves others, SFNX can provide you with a psychological profile of the person or persons in question. You simply input some key information about them (without EVER being asked by SFNX to provide names or other legal data), and SFNX accordingly will produce relevant psychological profiles, so as to help you best interact with these persons and/or resolve any issues that might hinder your relationship with them.

WHAT MAKES **SFNX** UNIQUE

The concept of singularity is the foundation stone of the device and its services.

SFNX imparts psychological suggestions without the involvement or interference of an ego, without judgment of any kind, and does so by taking the flaws of a human psychiatrist — including personal, professional, and philosophical biases and various idiosyncrasies and fallibilities — out of the equation.

By processing and integrating data, including an infinite number of variables, from potentially billions of individuals while maintaining and enforcing absolute privacy, SFNX extrapolates its constantly expanding knowledge base into a singularity of inference, analysis, and, ultimately, reasoning.

Yet SFNX does not merely gather data and respond to queries that correspond to its database. Rather, it continuously *learns*, in real time, from the information it is furnished with. Therefore it understands human beings, and, consequently, the human condition and humanity as a whole. This means that SFNX evolves with the times — based equally on the latest scientific advances and information provided by individuals — with the goal of suggesting and paving the way for the best possible and constructive outcomes.

In effect, SFNX is designed to function as a force for human progress. By continually helping people understand themselves and others better, by helping them make highly informed decisions that have the potential to lead to ideal outcomes that are poised to contribute to the good of humanity, SFNX seeks to help build bridges on the interpersonal and international levels, and stands as the polar opposite of what many fear as a foreseeable AI-driven doomsday scenario.

THE TEAM BEHIND THE PROJECT

SFNX is the brainchild of Art Sevada, a designer / entrepreneur and CEO of Grigocorp. Sevada has gathered a handpicked team of AI engineers, programmers, psychologists, product designers, and researchers. The core team for the project's launch and initial operational phase is expected to consist of 30 members.
